WHAT IS HARD WATER?

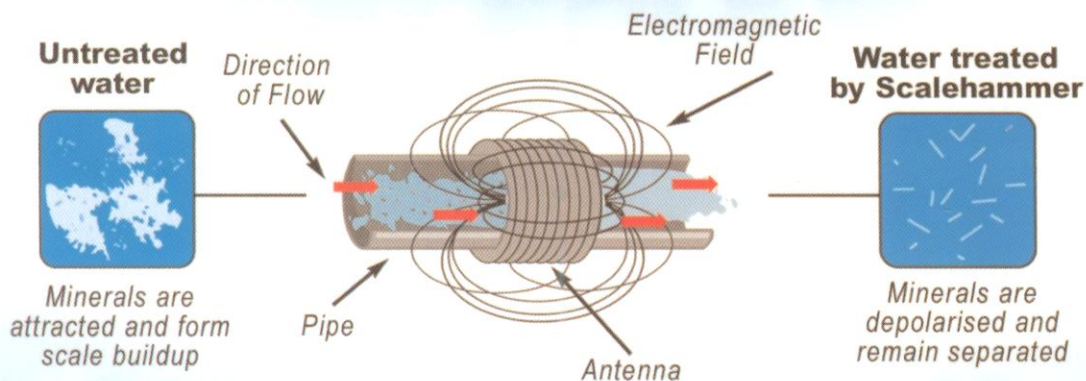

Hard water is water that has a high concentration of calcium and magnesium. Hard water is not a health risk but leads to scale buildup, which is the result of crystallization of minerals (see Water Hardness Table beside).

HOW DOES THE SCALEHAMMER WORK?

Scalehammer generates magnetic fields and transmits them in the water. The electromagnetic waves prevent the attraction of minerals that form scale buildup. As a result, the minerals remain in the water and no longer gather or cling to pipe walls (see illustration).

WATER HARDNESS TABLE

	GRAINS PER GALLON	PARTS PER MILLION (PPM)
Soft	Less than 1	Less than 17.1
Slightly Hard	1 to 3.5	17.1 to 60
Moderately Hard	3.5 to 7	60 to 120
Hard	7 to 10.5	120 to 180
Very Hard	10.5 and up	180 and up
